

## 2007 PREMIER | CARESCIENCE SELECT PRACTICE NATIONAL QUALITY LEADERS

Premier | CareScience Select Practice reports recognize hospitals with superior patient outcomes. Select Practice reports are developed using Premier | CareScience risk-adjusted methodology, which evaluates true quality and efficiency through comprehensive patient population analysis, utilizing a risk model that includes 16 clinical factors. This approach to risk adjustment provides hospitals and patients with a more objective source of information on hospital quality.

The Quality Index is calculated from the outcomes of Mortality, Morbidity, and Complications. The Efficiency Index is calculated from the Length of Stay outcome, utilizing it as a proxy for resource utilization. Quality and Efficiency Indices are normalized to 100 as average performance. Any value greater than 100 reflects the percent achievement above the norm. For example, a value of 120 reflects a 20% better performance than the average facility. Higher values indicate better quality or efficiency.

Values reported for mortality and length of stay reflect the difference between actual and expected values as calculated via the Premier | CareScience risk analysis model. A negative value reflects performance that is better than expected, meaning the actual outcome value was lower than what was predicted.
